Ai Knowledge Base

This is intended to be a collection of information regarding Avolites' Ai servers - see https://www.avolites.com/products/video. The focus is on the Ai software - a very unique, node-based mediaserver system. Of course there is plenty of official documentation available, in particular the help files which are included with the software, a designated facebook group, an Ai forum, and numerous videos.

However, a wiki has the opportunity to contribute some user generated content, and link the information together. Some parts where a wiki might be particularly useful are:

- Patching Basics - an introduction into the patch engine and how to make use of it
    - Customizing Patches and Modules explains details of working with patches and modules
- the modules of the patch engine
- Ai also comes with a number of ready-to-use patches for special tasks - they are listed in System and Factory Patches
- examples for the patch engine, based on the previously mentioned modules
- specific aspects of the use of Ai
- **out of numerous questions here is a list of DOs and DONTs when it comes to using a media server**
