

XML format

There are dozens of books on XML only - it is a widely used language for many purposes. As always, [wikipedia](#) is a good read. however, based on an example, the (for this purpose) essential items will be explained.

An example macro file might look like this:

```
<?xml version="1.0" encoding="utf-8"?>
<avolites.macros xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="Avolites.Menus.xsd">
  <!-- Macro to set PlaybackPaging to never. Sebastian Beutel with help by
Gregory Haynes 05/09/2016 -->
  <macro id="Avolites.Macros.PagingNeverHold" name="Set PbPaging to
NeverHold">
    <description>Sets PlaybackPaging to NeverHold.</description>
    <sequence>
      <step>ActionScript.SetProperty.Enum("Handles.HandlesHeldover",
"NeverHold")</step>
    </sequence>
  </macro>
</avolites.macros>
```

The 1st line

```
<?xml version="1.0" encoding="utf-8"?>
```

is the opening XML declaration. It is not required but good practice.

The 2nd line

```
<avolites.macros xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="Avolites.Menus.xsd">
```

has some required and some non-required parts:

- < the angled brackets > are essential for every xml tag
- avolites.macros is the essential macro tag which makes Titan interpret this file correctly
- the xmlns... part is the namespace of the file. It is not required and can be omitted.
- this line corresponds with the last line

```
</avolites.macros>
```

. Note the slash at the beginning which makes this a closing tag - **every tag needs to be closed!**

The 3rd line

```
<!-- Macro to set PlaybackPaging to never. ... -->
```

is a comment, and will not be interpreted by Titan. It is good practice to comment at least what the macro does and who wrote it - and in more advanced macros, comments on the real logic will be of great help.

The 4th line

```
<macro id="Avolites.Macros.PagingNeverHold" name="Set PbPaging to  
NeverHold">
```

corresponds with line 9

```
</macro>
```

. These two lines hold the macro itself - each file can hold multiple macros where each macro starts with `<macro ...>` and ends with the corresponding `</macro>`.

The parts `id=...` and `name=...` are properties of this macro:

- `id` is required and a unique identifier
- `name` is semi-required and is the name which is shown in Titan - if you omit it, then you'll only see something like 'Macro1'.

Lines 5 through 8

```
<description>Sets PlaybackPaging to NeverHold.</description>  
<sequence>  
  <step>ActionScript.SetProperty.Enum("Handles.HandlesHeldover",  
"NeverHold")</step>  
</sequence>
```

are the contents of our macro:

- `<description>` corresponds with the closing `</description>`, is optional, and may hold a longer description of the macro
- `<sequence>` corresponds with the closing `</sequence>` and holds the actions which the macro is to perform (one or more steps)
- `<step>...</step>` is the function which this step is to perform. In this case it calls the function `ActionScript.SetProperty.Enum()` with the arguments `"Handles.HandlesHeldover"` and `"NeverHold"`.

A brief introduction about possible functions [is available here](#). But essentially, this whole wiki is

dedicated to possible macros

further readings

- [Introduction to macros](#)
- [Console and simulator](#) - how actions on the consoles are described
- [Recorded vs. coded macros](#) - both kinds: Country, AND Western
- [Macro file format](#) - what to observe when creating macro files
- [Macro Folders](#) - where exactly are the macro files stored
- [Deploying macros](#) - how to import a macro file into Titan
- [XML format](#) - a veeeery basic introduction into the format macro files are written in
- [The Syntax of Functions](#) - understanding how functions are described in general
