

Web API request

# System/SoftwareVersion

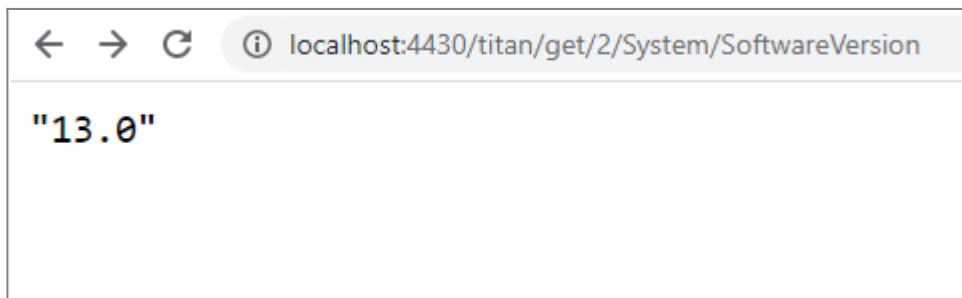

Returns the software version of the currently running titan installation.

<b>API</b>	<a href="https://api.avolites.com/12.0/System.SoftwareVersion.html">https://api.avolites.com/12.0/System.SoftwareVersion.html</a>
<b>namespace</b>	System
<b>usage</b>	<code>http://[ip]:4430/titan/get/2/System/SoftwareVersion</code>
<b>example</b>	<a href="http://localhost:4430/titan/get/2/System/SoftwareVersion">http://localhost:4430/titan/get/2/System/SoftwareVersion</a> (link opens in new tab)
<b>action</b>	none
<b>returns</b>	String with the software version, e.g. "13.0"
<b>remarks</b>	The API lists this in /get/2/ but from own tests I can say it also works in /get/ and /get/1/ as well

This may be used to check if there is a proper connection to a Titan installation.

Also, for some use cases the software version is important (e.g. the returned JSON object for handles may differ).
